

- Screenshot showing Python Hello World running in the terminal

The screenshot shows the Visual Studio Code editor with a file named `test.py` open. The code in the editor is:

```
1 print("Hello from Python")
2
```

The terminal at the bottom shows the command `python -u "C:\Users\Jeevith R\Desktop\Activity 2\test.py"` being executed, resulting in the output `Hello from Python`.

- Screenshot showing Java Hello World running in the terminal

The screenshot shows the Visual Studio Code editor with a file named `Test.java` open. The code in the editor is:

```
1 public class Test {
2     public static void main(String[] args) {
3         System.out.println("Hello from Java");
4     }
5 }
```

The terminal at the bottom shows the command `cd "C:\Users\Jeevith R\Desktop\Activity 2"; if ($?) { javac Test.java }; if ($?) { java Test }` being executed, resulting in the output `Hello from Java`.

- Before/after screenshot of a file formatted with Prettier

- Screenshot of GitLens blame annotations on a committed file

- Screenshot of an active Live Share session with your partner's cursor visible

- One-paragraph written comparison covering the Part B discussion questions

Comparison: Python and Java extensions make coding easier by providing syntax highlighting, auto-completion, and run/debug features for their respective languages. Prettier mainly improves code formatting by automatically organizing indentation, spacing, and quotes. GitLens is useful for understanding code history because it shows who changed a line and provides commit and file history. Live Share is different because it focuses on real-time collaboration, allowing two students to edit the same file and see each other's cursors. I would keep Prettier and GitLens enabled for most projects, while Python and Java extensions are especially useful when working with those languages. Live Share is more interactive than normal screen sharing because both users can work directly in the same VS Code environment.
